Undoing daisy-chaining on POC registers
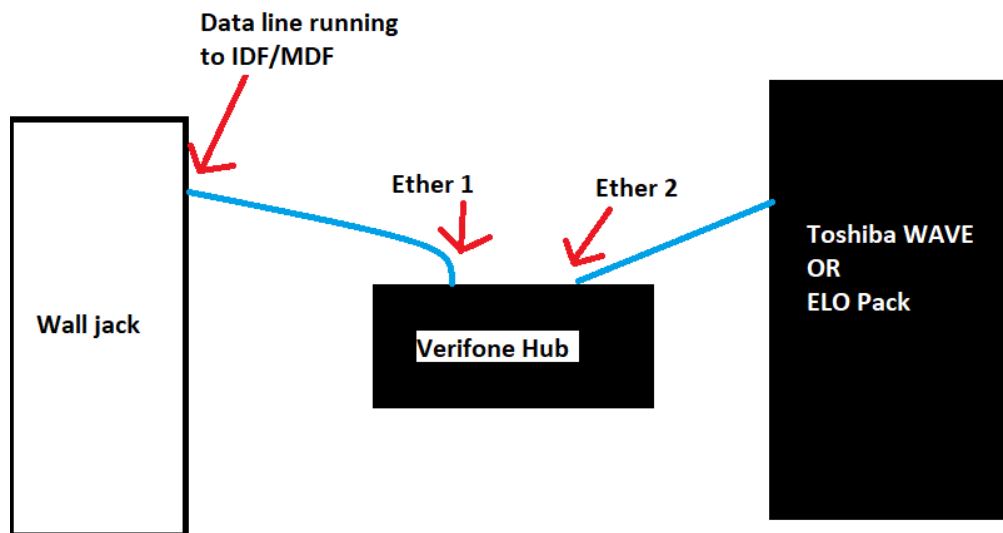

When a register and a pinpad are on the same port, the setup will **initially look like this:**

Data line running to IDF/MDF

Ether 1 **Ether 2**

Wall jack

Verifone Hub

Toshiba WAVE OR ELO Pack

To connect the register and pinpad to separate ports:

1. Unplug the Ether 2 connection (going to the register WAVE or ELO) on the Verifone hub;
2. Plug it in to another open port on the data jack;
3. Confirm network connection by running test transaction on register or checking with Kohl's support

Afterwards, the network connections should look like this:

Separate data ports

Ether 1

Wall jack

Verifone Hub

Toshiba WAVE OR ELO pack
